                                          Human PH30 beta chain sperm protein, having a FEE integrin binding domain, is 58.9% identical to mouse and 56.5% identical to guinea pig PH30 beta. The protein may be produced recombinantly and used in a contraceptive composition containing an effective adjuwant and an amount of sperm protein which is effective for the stimulation of antibodies which bind to sperm protein—in willow, thereby preventing or substantially reducing the rate of sperm-egg fusion
                                                                                                                                                                                                                                                                             40

The method of the invention is useful for detecting/diagnoshing, treating and monitoring a cancer or condition characterised by the expression of a human CT antigen. The present amino acid sequence represents a human CT antigen of

The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a patient sample and the normal level of expression of a marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal control non-prostate cancer useful for diagnosing or treating prostate cancer.

Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in the prostate cancer, and may be useful in gene therapy. Sequences given in cancer their patient form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a control non-prostate cancer sample where a significant increase in the level of expression of the marker in the patient sample and the normal level of expression of the marker in the patient sample and the normal level of expression of the marker in the patient sample and the normal level of expression of the marker in the patient sample and the normal level of expression of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in Abb7317-Abb7531 ropresent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but we was obtained in electronic format directly from WIPO at

The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a control non-prostate cancer sample, where a significant increase in the control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal control non-prostate cancer.

Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequence given in ADB75531 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TCCGGCTGGGACCCAGGACTTCAAGCCATGTGGGTCTTGTTTCTGCTCAGCGGGCTCGGC 104

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        443
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          503
                                                                                                                                                                                                                                                                                                                               Human PH30 beta chain sperm protein, having an FEE integrin binding domain, may be recombinantly produced by vector-mediated gene expression in host cells, preferably mammalian cells e.g. Chinses hamster ovary (CHO) cell culture. It may be used in a contraceptive composition containing an effective adjuvant and an amount of sperm protein which is effective for the stimulation of antibodies which bind to sperm protein in vivo, thereby preventing or substantially reducing the rate of sperm of surface distunctions. The protein is also useful for identifying small molecules that disrupt sperm-egg interaction and fertilization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        21

```
Mouse PH30 beta chain sperm protein, having a QDE integrin binding domain, is 55.2% identical to guinea pig PH30 beta. The protein may be produced recombinantly and used in a contraceptive composition containing an effective adjuvant and an amount of sperm protein which is effective for the stimulation of antibodies which bind to sperm protein in vivo, thereby preventing or substantially reducing the rate of sperm-egg fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120 AGTAATTTTGATAGTTTACCTGTGCAAATTACAGTTCCGGAGAAAATACGGTCAATAATA 179

                                                                                                                                                                                  780
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     501
```

polypeptides are used to identify modulators. A peptide, phosphopeptide, small organic molecule or an antibody is used to inhibit aberrant activity of a 55294 or 56629-expressing cell, located in a cancerous or pre-cancerous tissue. A compound that modulates the activity or expression of the polynuclectides are used to treat or prevent a disorder characterized by aberrant activity of a 56294 or 56629-expressing cell, in a subject. The present sequence represents the human 56294 protein 820 318 132 266 62 Length:

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosting tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in pericyte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating or inhibiting the proliferation of normal human dermal fibroblast calls. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AAU83592-AAU83713 represent human PRO protein sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                     One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for treating a PRO related disorder and for diagnosing tumors such as lung cancer, colon cancer, breast tumor, prostate tumor, rectal tumor or liver tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         81 GlnGlySerMetAsnThrTyrSerSerAspIleGlnThrGlnCysTyrTyrGlnGlyAsn 100

                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to the isolation of novel human PRO polypeptides and the polymucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polymucleotides are useful for preparing a medicament useful in the diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABUS0739-ABUS0860 from recombinant was obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html

The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification; or the full length coding sequence of any these 122 nucleotide sequences. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, blosensors or bioreactors. These are cumulative useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, rectal tumour, or liver tumour) in amamal, for stimulating the release of TNF-alpha from human blood, or cornal human dermal fibrolliferation or differentiation of chondrocyte cells, for stimulating proliferation of pericyte cells, or for modulating normal fibrollate proliferation. The PRO nucleic acid or cornal human dermal fibrollate proliferation of pericyte cells, or for modulating colypeptide is also useful for treating tumours or various bone and/or cartilage disorders (e.g. sports injuries or arthritis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets of the presence of these diseases. The PRO polypeptides are destinantiation of the presence of these diseases. The PRO polypeptides are destinant publication probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may gene films is the amino acid sequence of a novel human secreted and
                                                                                                                                                                                                                                                                                                                                            New genes, and its encoded secreted and transmembrane polypeptides, useful for stimulating Tumor Necrosis Factor alpha, or chondrocyte or pericyte proliferation, especially for treating lung tumors, arthritis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  129 GATAGITTACCIGIGCAAATTACAGITCCGGAGAAAATACGGICAATAATAAAGGAAGGA 188

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes one hundred and eighty seven nucleic acids encoding novel human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, ageralated macular degeneration, atherosclerosis, hypertension, arterial thrombophlebitis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, undur angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             :::|||:::

The invention relates to a novel isolated nucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells or the release of TNF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or differentiation, the stimulation of human dermal fibroblast cell proliferation and the detection of the presence of a tumour within a mammal. Furthermore, the nucleic acid may be useful for the manufacture of a medicament for diagnosing or treating a tumour within a mammal or for measuring or detecting the expression of an associated gene, as well as during gene therapy. The current sequence is that of the human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  72 ATGIGGGICTTGTTTCTGCTCAGCGGGTCGGGGCTGCGGAIGGAC---AGTAATTTT 128

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel isolated PRO protein encoding nucleic acid. The nucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tumour in a mammal. Furthermore, the molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells, the release of tumour necrosis factor (TNF)-alpha from human blood, the proliferation or differentiation of chondrocyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO protein of the invention

The invention relates to an isolated nucleic acid encoding a PRO
polypeptide. Nucleic acids that encode PRO can be used to generate either
transganic animals or knock-out animals useful in developing and
creening of therapeutically useful reagents. The nucleic acids may also
be used in gene therapy for replacing defective gene, in chromosome
identification, as chromosome markers, or in generating probes to isolate
identification, TNP-alpha stimulation, human dermal fibroblasts stimulation
timulation, TNP-alpha stimulation, human dermal fibroblasts stimulation
chromosome
of the isolated nucleic acids may be used for recombinantly expressing
those markers. The PRO polypeptides and nucleic acids may also be used in
the isolated nucleic acids may be used for recombinantly expressing
those markers. The PRO polypeptides and nucleic acids may also be used in
tissue typing Anti-PRO antibodies are useful in diagnostic assays for
PRO and in affinity purification of PRO from recombinant cell culture or
natural sources. The present sequence represents the amino acid sequence
of a human secreted/transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    72 ATGIGGGTCTTGTTTCTGCTCAGGGGCTCGGGGCTGCGGATGGAC---AGTAATTTT 128

MOICHIGH evaluation of fertilin as an immunocontraceptive antigen and molecular cloning of the cynomolgus monkey fertilin beta subunit.";

MOICHIGH EAPLOAD Sperm surface membrane protein that may be involved in sperm-egg plasma membrane adhesion and fusion during cfertilization. Could have a direct role in sperm-zona binding or migration of sperm from the uterus into the oviduct. Interactions with egg membrane could be mediated via binding between its disintegrin-like domain to one or more integrins receptors on the egg. This is a non catalytic metalloprotease-like protein (By eliminarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBUNIT: Heterodimer with ADAMI/fertilin alpha.
SUBURILIT: Heterodimer with ADAMI/fertilin alpha.
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed specifically in testis.
DOMAIN: A tripeptide motif (FDE) within disintegrin-like domain could mediate sperim-degg binding (By similarity).
Fould mediate sperim-megg binding (By similarity).
The signal and the metalloprotease domain are cleaved during the epididymal maturation of the spermatozoa (By similarity).
SIMILARITY: Contains I disintegrin domain.
SIMILARITY: Contains I EGF-like domain.
                                                                                                                                                                                                                                                D AD02 MACFA STANDARD, PRT; 735 AA.
